INTRODUCTION

Online Canteen Ordering System is a front-end web application for a college canteen. Our project, CampusBites Canteen, allows students to browse food items, add them to a cart, change quantities, view the total bill and place a mock order. A confirmation interface appears after the order is placed.

The application is built using HTML, CSS and JavaScript. HTML defines the page structure, CSS styles the menu and cart, and JavaScript manages food filtering, cart updates and order confirmation. The uploaded implementation contains eight food items across four categories: Snacks, Meals, Beverages and Desserts.

Project objectives

1. Display food names, photographs and prices in a clear menu.
2. Filter items by food category.
3. Add items to a cart and increase or decrease their quantities.
4. Calculate the total bill automatically from item prices and quantities.
5. Prevent an order when the cart is empty.
6. Show a mock confirmation and allow the user to return to the menu.

Project scope

This project demonstrates the ordering interface in the browser. Cart data is stored in a JavaScript array during the current page session. It does not include a server, database, login, payment processing or actual communication with a canteen. The confirmation uses the fixed demonstration order ID #001; refreshing the page resets the cart.

METHOD

Technologies and files

7. index.html: contains the header, category buttons, menu grid, cart panel and confirmation screen.
8. style.css: defines colours, spacing, buttons, food cards, grid and flexible page layout.
9. app.js: contains the food data and functions for menu rendering, category filtering, cart management and mock ordering.
10. Eight JPG files: provide photographs for the eight food items.

Working procedure

On page load, renderFoodItems(foodItems) displays the menu and updateCartUI() initializes the empty cart.

filterCategory() selects matching items and highlights the selected category button.

addToCart() finds the food item by ID. It adds a new cart entry or increases an existing entry's quantity.

changeQuantity() changes a quantity and removes an item when its quantity becomes zero or less.

updateCartUI() rebuilds the cart display, counts all quantities and calculates the total bill.

placeOrder() checks for an empty cart. For a non-empty cart, it displays the confirmation, hides the menu and clears the cart.

resetToMenu() returns to the menu. scrollToCart() moves the page to the cart panel.

Total bill = sum of (item price × item quantity). For example, two portions of Samosa (2 pcs) at ₹30 each and one Cold Coffee at ₹50 give a total of ₹110.

ADVANTAGES

11. Students can view all listed food items and prices in one place.
12. Category buttons help students find the type of food they want.
13. Quantity controls make it easy to adjust an order before confirmation.
14. Automatic calculation reduces manual bill calculation errors.
15. The cart count and total update immediately after each change.
16. The application can be opened directly in a browser without backend installation.
17. Separate HTML, CSS and JavaScript files make the project easier to understand and maintain.

CODE

The following source code is taken from the uploaded project files. The JPG food images remain separate assets referenced by app.js.

OUTPUT

Menu and cart

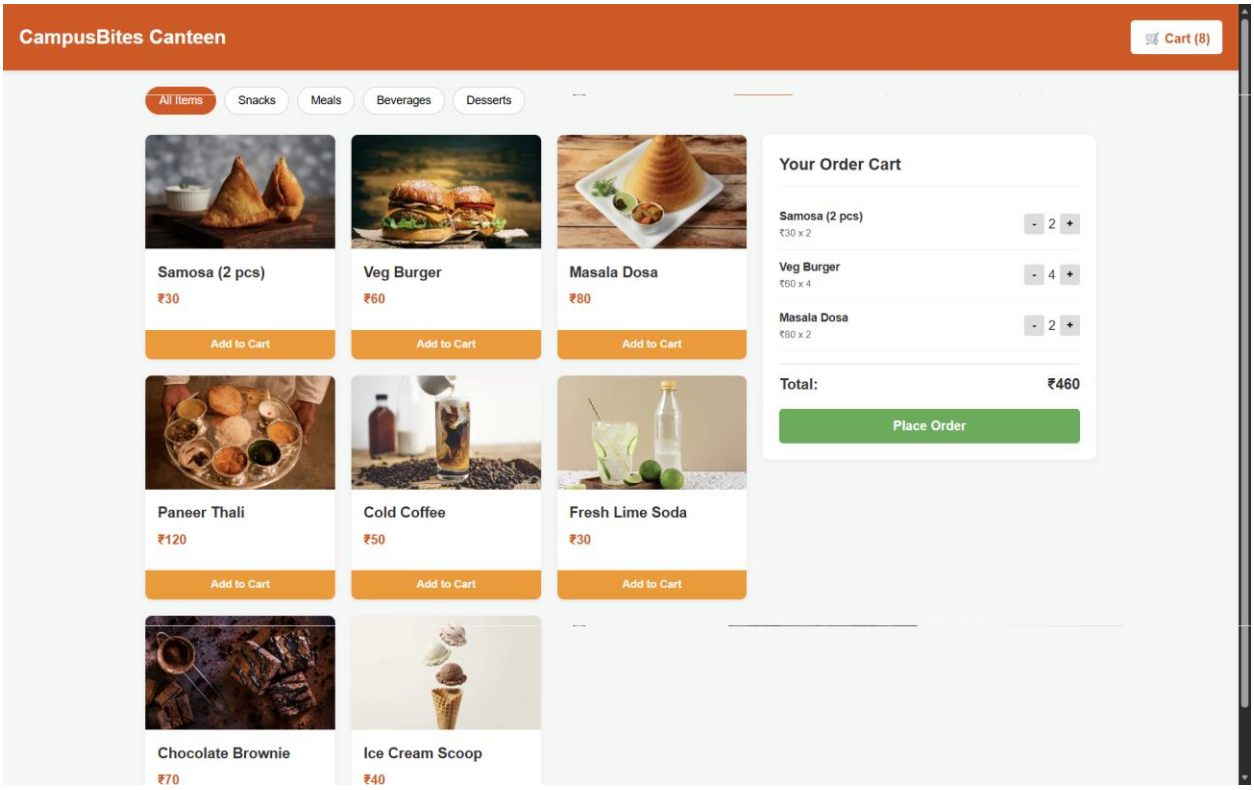

Figure 1 Menu and cart showing 8 items with a total bill of ₹460

Order confirmation

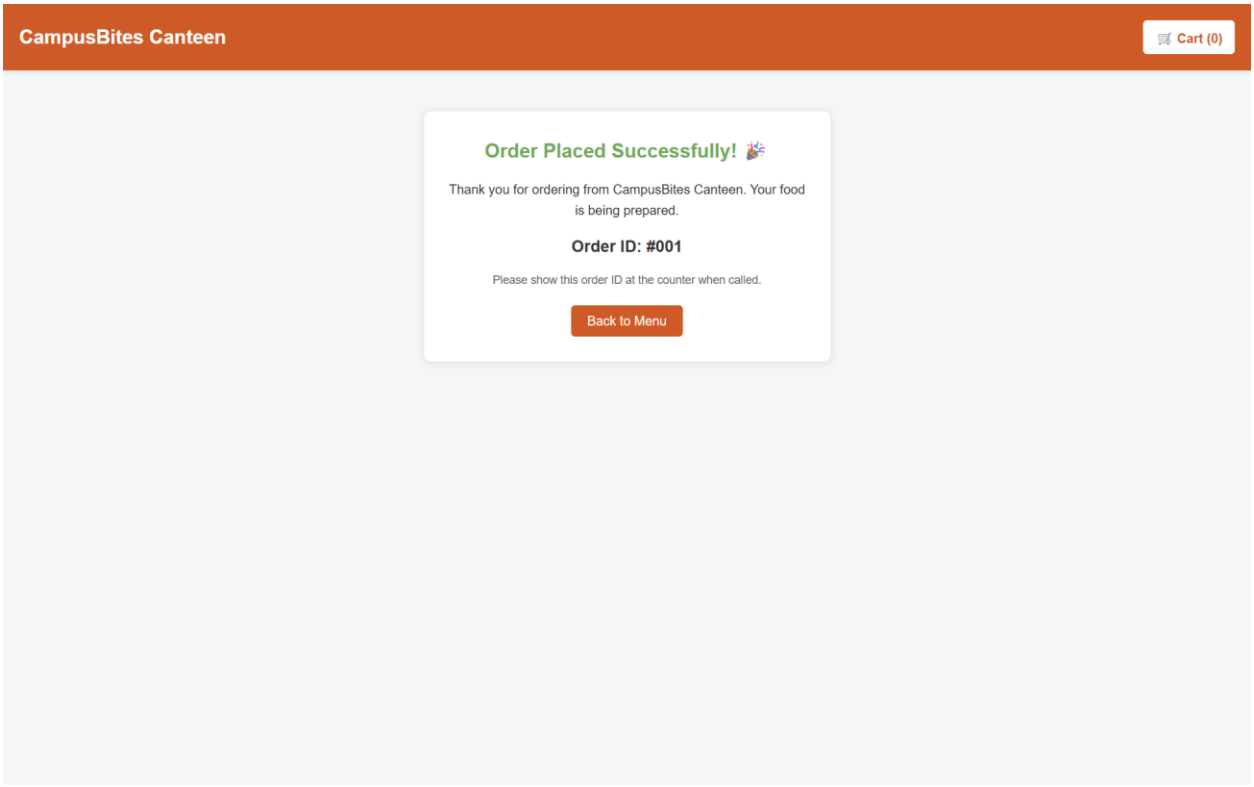

Figure 2 Mock order confirmation showing Order ID #001

The cart screenshot shows two portions of Samosa (2 pcs), four Veg Burgers and two Masala Dosas. The total is (₹30 × 2) + (₹60 × 4) + (₹80 × 2) = ₹460. The confirmation is a front-end demonstration and does not send an order to a server.

CONCLUSION

CampusBites Canteen implements the main requirements of the Online Canteen Ordering System as a front-end demonstration. It provides menu browsing, category filtering, cart quantity changes, automatic bill calculation and a mock order confirmation. The project demonstrates how HTML, CSS and JavaScript work together to build an interactive ordering interface.

Future development could add a backend and database for storing orders, unique order IDs, student authentication, payment integration, availability management and order status tracking. These features are outside the current implementation.
